

The Falklands / Malvinas War Map

The movement from San Carlos toward Stanley

18 MAY - 13 JUNE 1982

A dated field of states, forces, people, losses, places, and events before the campaign endpoint.

ONE MAP / CHANGING FIELD

Choosing the informative interval

A war map is one recurring structure populated by a different conflict and interval. The interval is selected where the movement that later prevailed is underway but victory has not yet removed the contested field.

THE FOCAL-RANGE RULE

Begin before the retrospectively decisive movement. End before the conflict endpoint.

This keeps occupation, resistance, command decisions, losses, uncertainty, and competing capacity visible at once. It avoids selecting only the opening shock or the spectacle of final destruction.

The rule does not turn hindsight into inevitability. The focal movement is an interpretive selection that must be stated, sourced, and open to revision. Other intervals can be generated from the same conflict record.

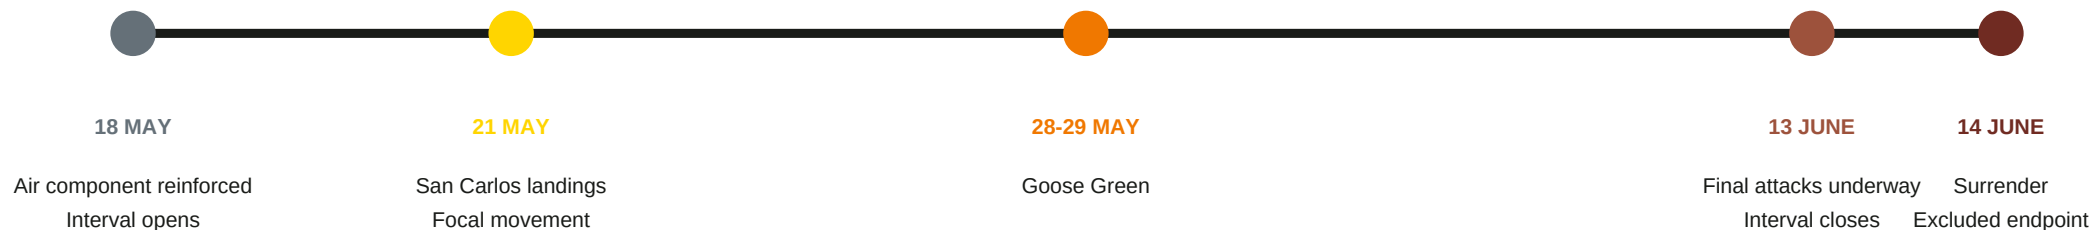

FALKLANDS / MALVINAS SELECTION

The interval opens before British forces established the San Carlos beachhead and closes before the Argentine surrender on 14 June. In retrospect, the landing moved the campaign from maritime approach to a sustained land advance. The atlas treats this as the focal movement, not as a claim that one event alone caused the outcome.

INTERVAL ADDRESS

Before the landing / before surrender

The selected frame begins three days before San Carlos and ends one day before the formal surrender. Events outside it remain context, not plotted observations.

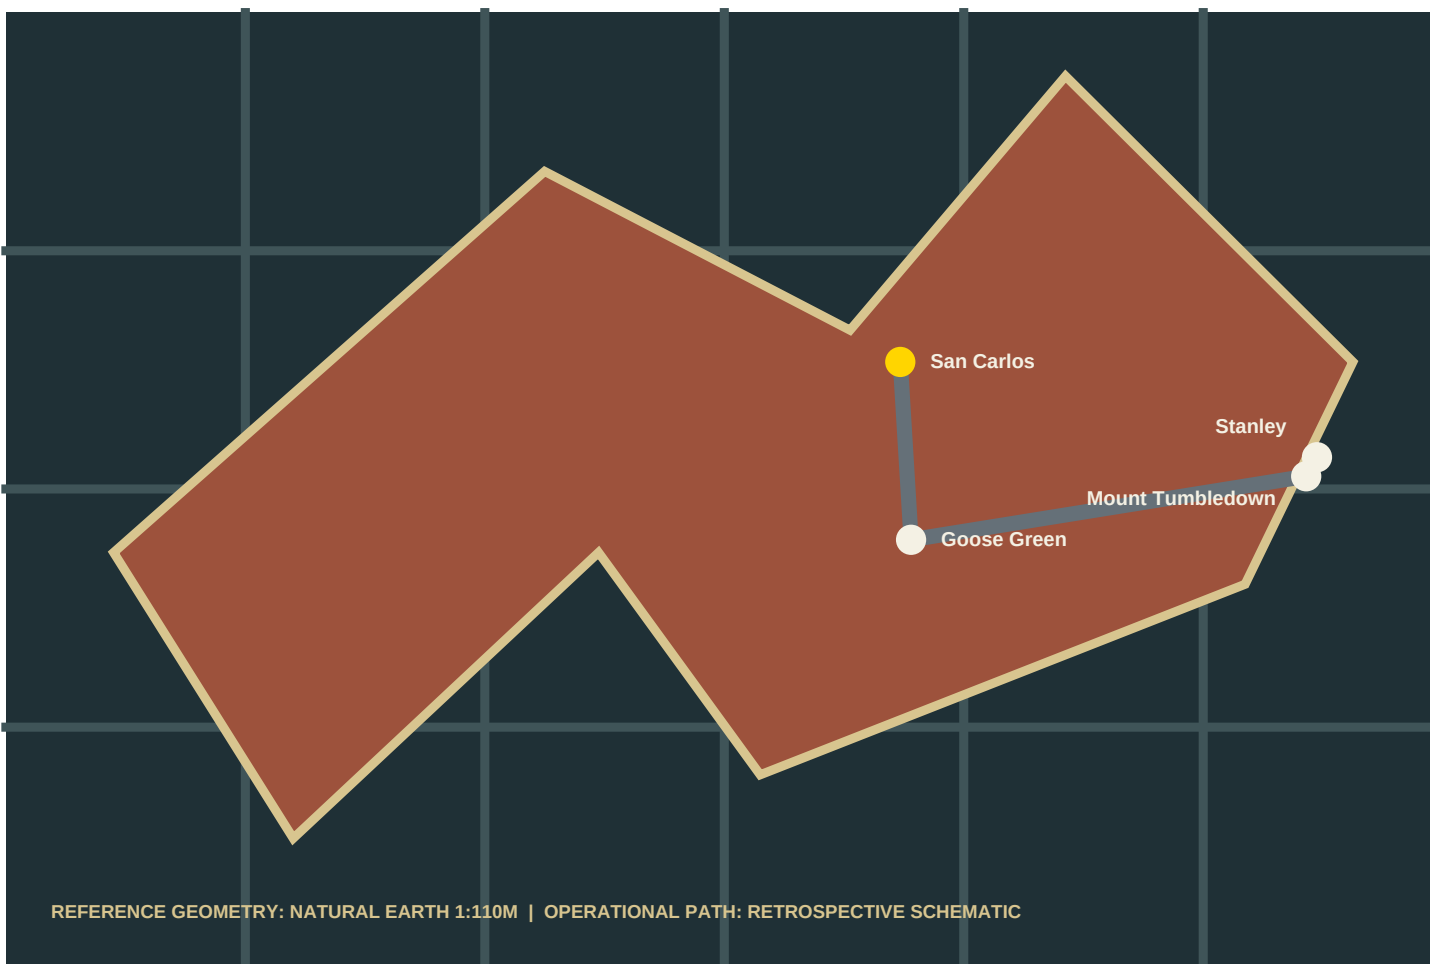

DATA BOUNDARY

UCDP supplies one 1982 conflict-year record for conflict 346. The dated sequence on subsequent pages is a curated print layer from the cited National Army Museum, RAF Museum, Argentine government, and parliamentary records. It is not represented as UCDP event data.

OPERATIONAL FIELD

The movement across East Falkland

Clay records the Argentine-held island field at the opening of the interval. The slate path is a retrospective schematic of the British movement from the San Carlos beachhead toward Stanley.

OPENING CONDITION

Argentine forces occupied the islands. The British land force had not yet established its beachhead.

DEPARTURE

The 21 May landing established a sustained land position. Fighting at sea and in the air continued around it.

ENDPOINT WITHHELD

The map stops while final attacks are underway, before surrender resolves the field.

REPORTED DEATHS

Conflict mortality is not scenery

The print field begins with reported deaths, but does not use trauma as visual spectacle. Counts remain attached to producer and denominator.

649 Argentine deaths

255 British personnel deaths

3 Falkland Island civilian deaths

907

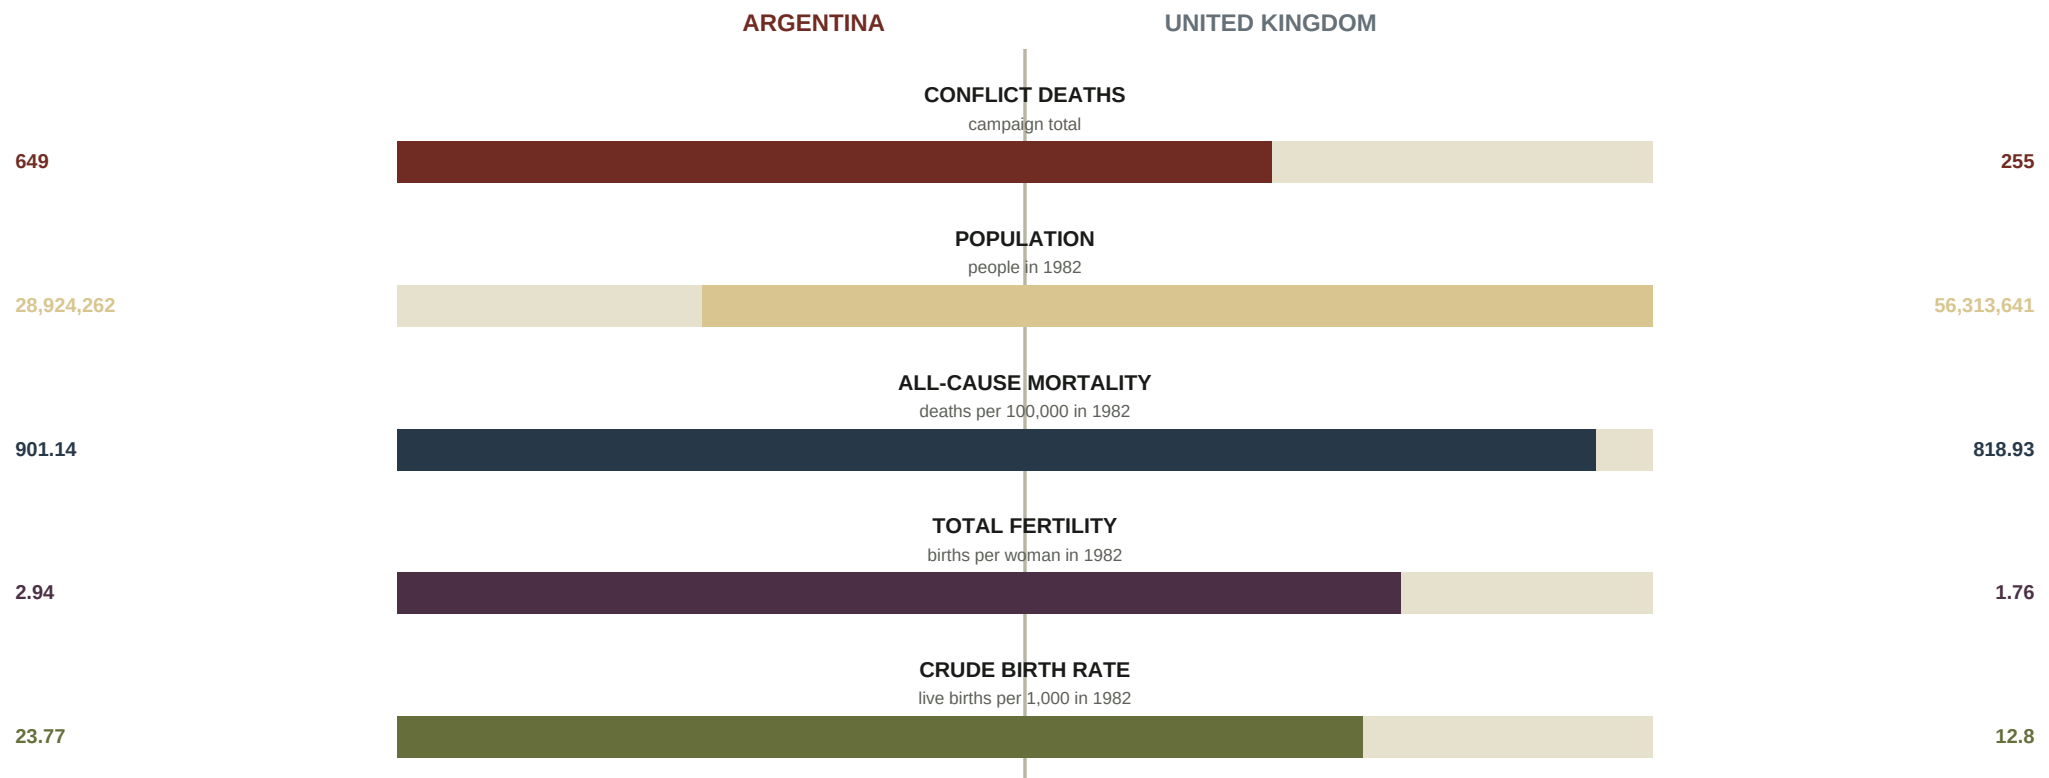

reported deaths across the three displayed categories

The UK MOD cohort study reports 237 armed-forces personnel dying during its defined campaign period. The museum and parliamentary total of 255 uses a broader campaign convention. Both are cited; they are not silently merged.

FIVE MEASURES / FIVE SCALES

The conflict inside the living field

Campaign deaths are set against the annual population-health observations that contain the conflict period. Bar length compares the two state records within a row only; unlike units are never added.

TEMPORAL AND MEASUREMENT BOUNDARY

Conflict record: 1982-04-02 through 1982-06-14. The 649 and 255 death figures are cited campaign totals, not deaths isolated to the 18 May-13 June focal field. Population is a mid-year count; mortality, fertility, and crude birth rate are annual 1982 observations. Each remains attached to its producer and denominator.

UCDP SIDE A

Argentina

State record at the focal interval, followed by observed population-health trajectories. These series provide recovery context; they do not identify the conflict as their cause.

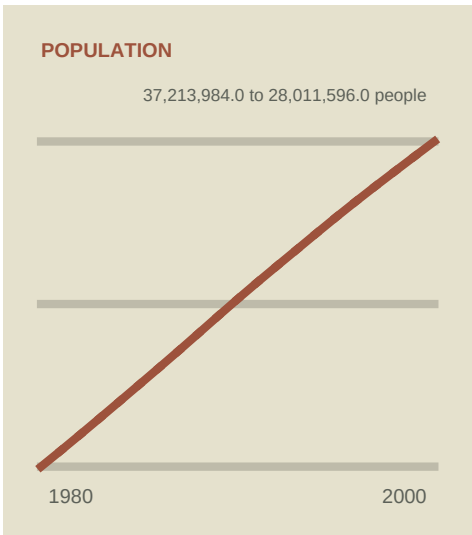

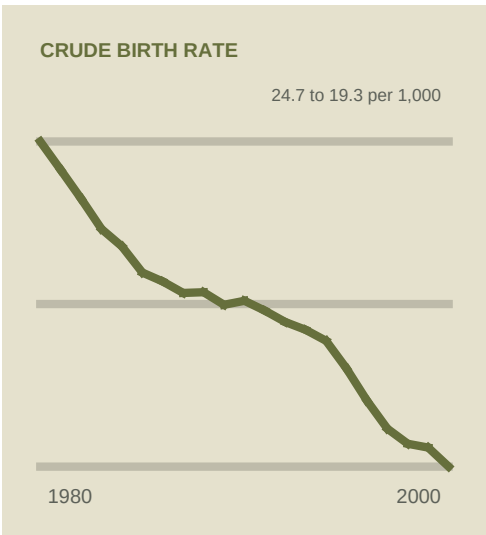

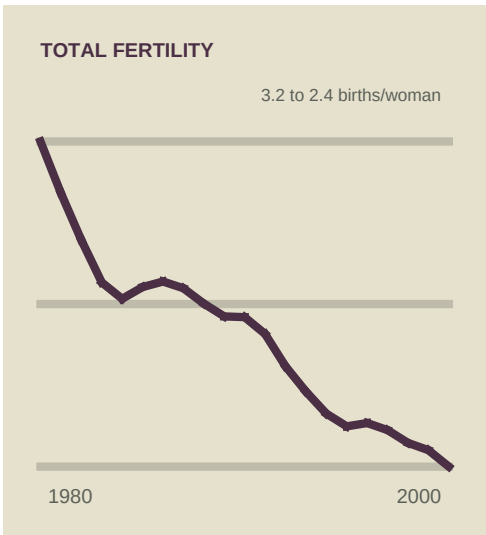

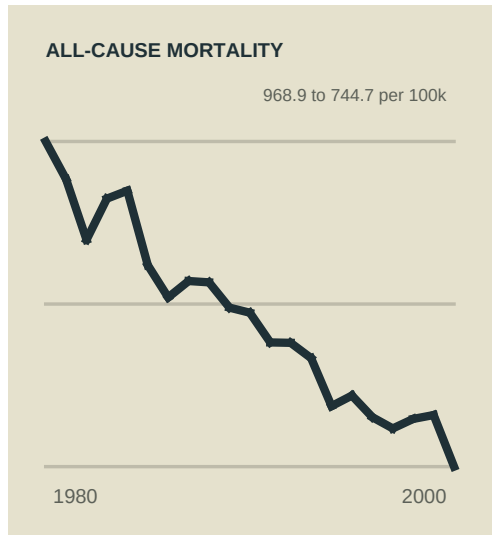

UCDP 1982

Side A / intensity 1

Government of Argentina is the state party encoded in UCDP conflict 346.

V-DEM 1982

V-Dem observation loaded

UCDP SIDE B

United Kingdom

State record at the focal interval, followed by observed population-health trajectories. These series provide recovery context; they do not identify the conflict as their cause.

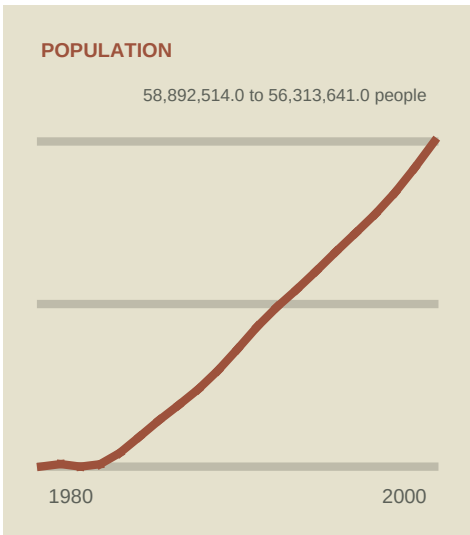

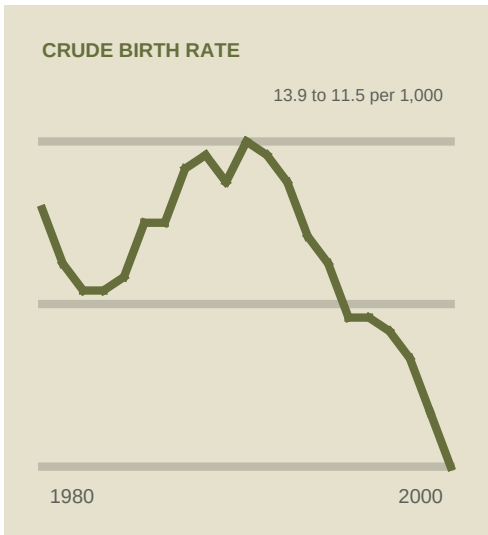

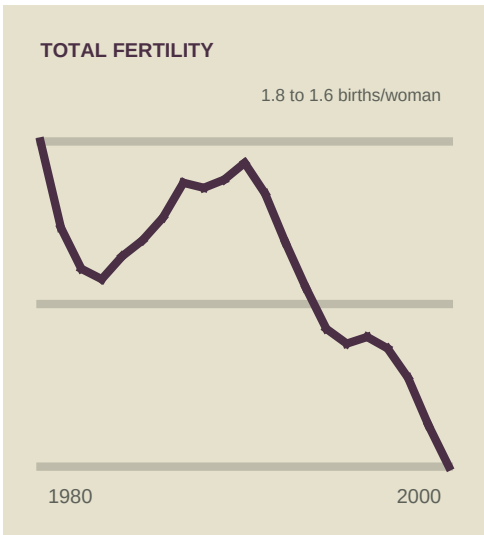

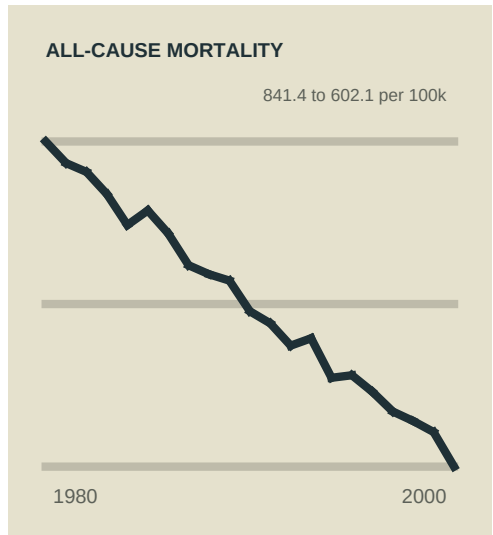

UCDP 1982

Side B / intensity 1

Government of United Kingdom is the state party encoded in UCDP conflict 346.

V-DEM 1982

V-Dem observation loaded

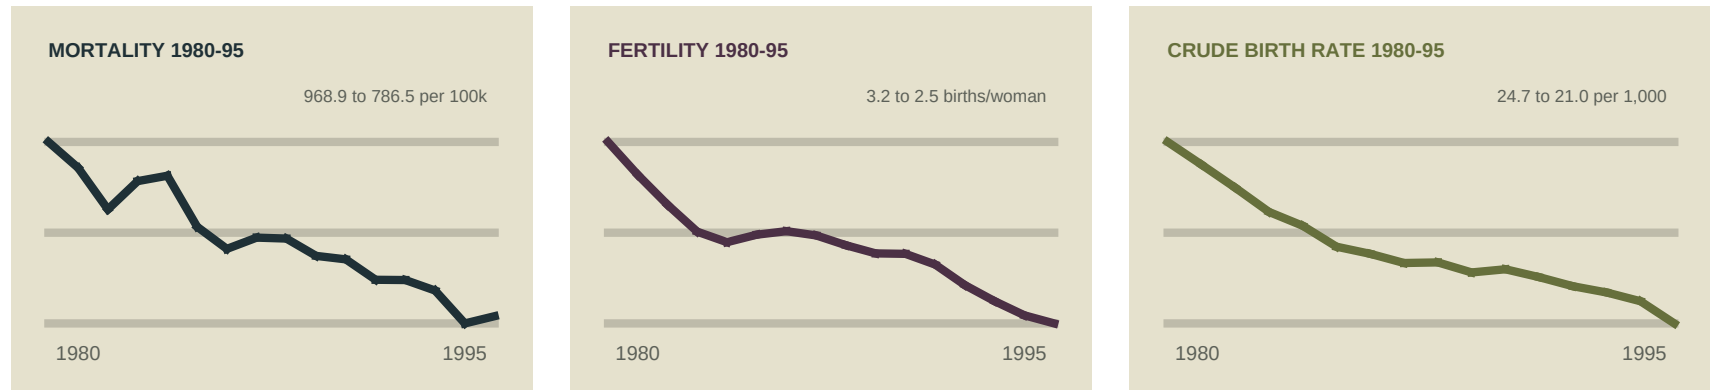

OBSERVED AFTERLIVES

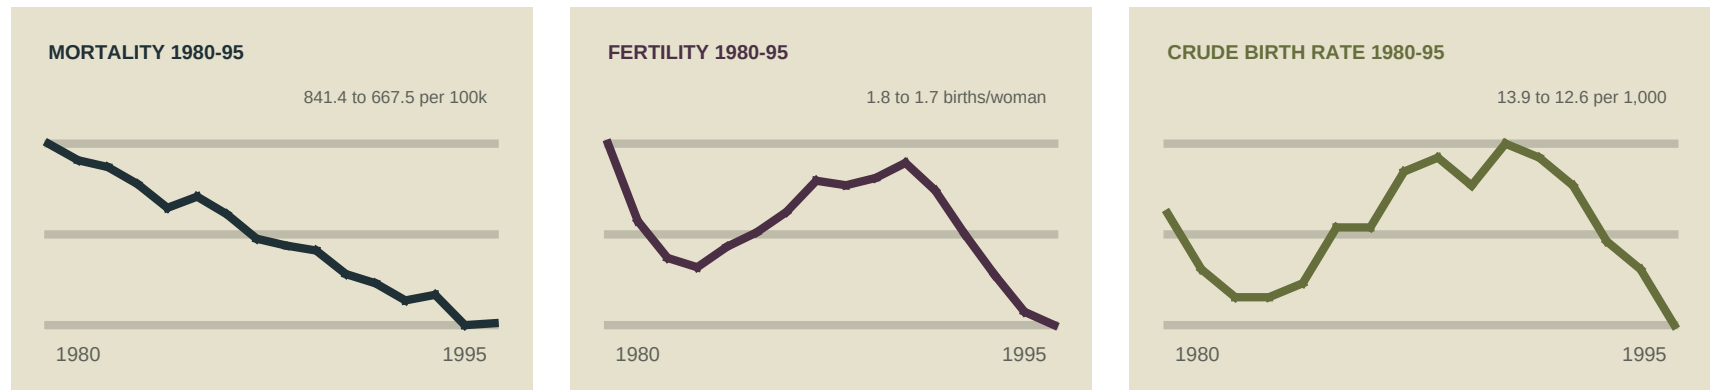

War ends / population continues

Mortality, fertility, and crude birth rate remain separate measures. A postwar change can frame a question about recovery, but temporal sequence alone does not establish that war caused the change.

ARGENTINA

UNITED KINGDOM

Future volumes can test whether demographic departures precede, accompany, or follow changes in military capacity. This prototype does not infer a baby-boom-to-war causal path from two national series.

DATED OBSERVATIONS

The field remains unresolved

The event sequence is bounded by the chosen interval. The formal surrender on 14 June is shown only as the excluded endpoint.

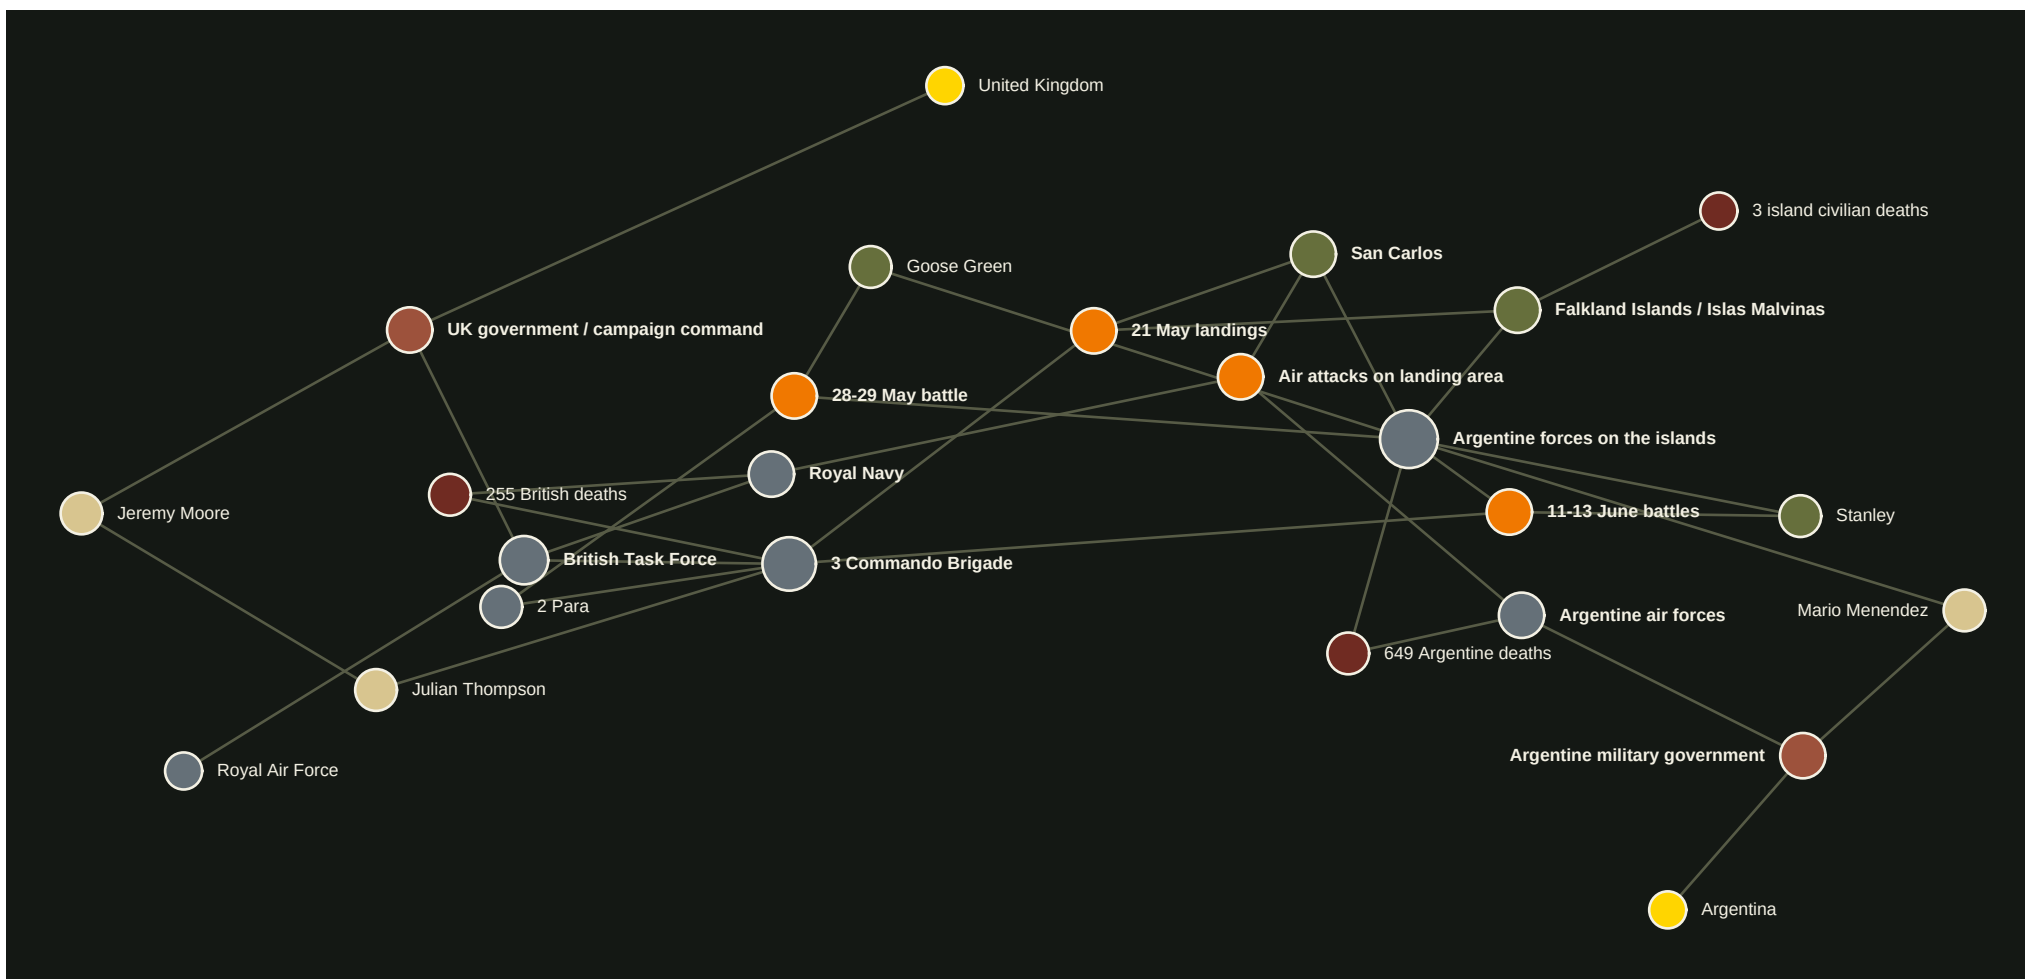

READING DIRECTION

Slate marks British movement or capacity; oxblood marks Argentine attacks or losses imposed on the British force; orange marks direct engagements. Colors identify roles in this selected record, not moral standing.

MECHANICS OF THE INTERVAL

People, forces, places, events, losses

The network is a sourced analytical diagram for the focal range. Node area follows degree. Lines indicate an encoded relation in this print specification, not command unless the connected labels state a command relation.

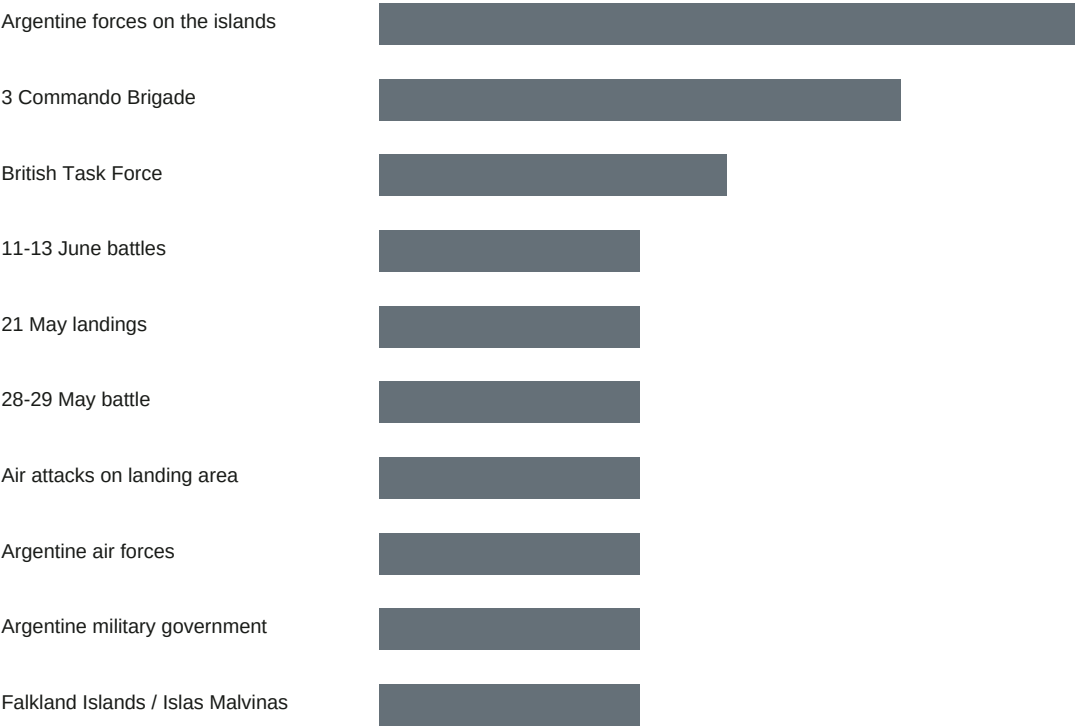

STRUCTURAL DIAGNOSTICS

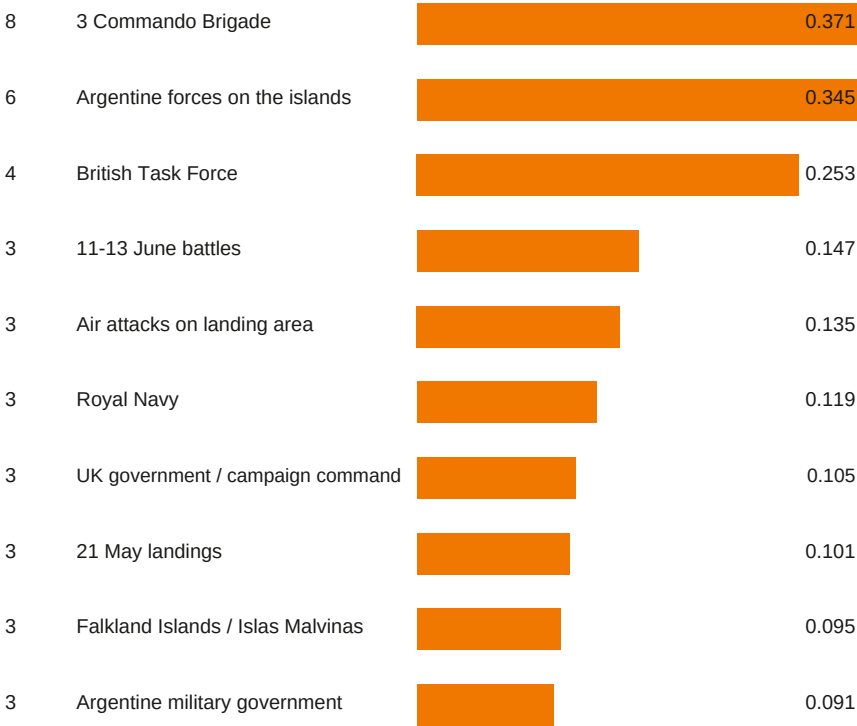

Degree and betweenness

Degree counts direct relations in this edition. Normalized betweenness estimates how often a node lies on shortest paths between other nodes. Neither measure proves authority, courage, responsibility, or causal control.

HIGHEST DEGREE

HIGHEST NORMALIZED BETWEENNESS

DEGREE DISTRIBUTION

degree 1: 4 nodes / degree 2: 8 nodes / degree 3: 10 nodes / degree 4: 1 node / degree 6: 1 node / degree 8: 1 node

PROVENANCE AND LIMITS

Sources / transformations / revision path

Every dated claim in the print layer is addressable to a listed producer. The map and network are project transformations; source observations retain their producers and boundaries.
