

THE WAR MAPS PROJECT / CURRENT FIELD PROOF

The Iran War Map

The unresolved regional event field

28 FEBRUARY - 30 JULY 2026

125 candidate events connected to their recorded locales. The field remains unresolved beyond the source boundary.

UCDP CANDIDATE CONFLICT 16905 / STATE-BASED / OPEN AT SOURCE BOUNDARY

CURRENT WAR / UNRESOLVED OUTCOME

No retrospective turning point yet

The historical War Map rule selects a movement visible before eventual victory. A current conflict has no such hindsight. This proof therefore maps the complete observed candidate-event interval without predicting its endpoint.

CURRENT-FIELD RULE

Begin at the first observed departure. End at the latest source observation. Keep the frontier open.

The map does not borrow certainty from a future outcome. It retains the event field, recorded parties, locations, casualties, source status, and unanswered causal structure available now.

The source currently begins on 28 February and contains events through 30 July 2026. The project date is later than the observation boundary; the missing interval remains missing.

SELECTION STATEMENT

This current-war proof cannot identify a retrospectively decisive movement because the outcome is unresolved. It therefore encloses the complete observed candidate-event interval and treats 28 February only as the opening departure in the loaded record. The frame ends at the latest observed event, not at the present and not at a conflict endpoint.

CANDIDATE-EVENT ACCUMULATION

The field develops by month

Counts show observations in the loaded candidate-event snapshots. Fatalities are summed best estimates and remain provisional; neither measure is an attack-direction variable.

READING THE INTERVAL

The opening month contains both the largest candidate-event fatality aggregate and the beginning of the multi-locale structure. Later observations extend the temporal enclosure; they do not retroactively establish an eventual winner or decisive movement.

EVERY EVENT / RECORDED COORDINATES

One conflict, twelve event locales

The formal UCDP dyad occupies a wider geographic event surface. Circles are candidate events; area rises logarithmically with the reported best fatality estimate. Country fill identifies recorded locale, not belligerent membership.

BOUNDARY

Natural Earth supplies reference geometry. UCDP supplies event coordinates, location precision, status, parties, and fatality ranges. Overlapping circles remain separate observations in the source record.

LOCALE PROPORTIONALITY

Where observations and reported deaths accumulate

Event share and fatality share use different denominators. A locale can contain many low-fatality observations or few high-fatality observations; both proportions remain visible.

RECORDED LOCALE		EVENT SHARE		FATALITY SHARE	
Iran	79/125		63.2%	3,622	95.1%
United Arab Emirates	10/125		8.0%	12	0.3%
Kuwait	8/125		6.4%	15	0.4%
Iraq	7/125		5.6%	13	0.3%
Lebanon	7/125		5.6%	15	0.4%
Israel	4/125		3.2%	9	0.2%
Bahrain	3/125		2.4%	3	0.1%
Saudi Arabia	3/125		2.4%	5	0.1%
Jordan	1/125		0.8%	3	0.1%
Oman	1/125		0.8%	2	0.1%
Sri Lanka	1/125		0.8%	104	2.7%
Syria	1/125		0.8%	5	0.1%

GCC VULNERABILITY FIELD 25/125 observations (20.0%) / 37/3,808 best-estimate fatalities (1.0%)

ISOMETRIC REGIONAL COMPARISON

Relative stacks across the vulnerability field

Each metric forms a separate stack at every observed locale. Stack height is normalized within that metric and carries no shared vertical unit. The basing-context stack is ordinal only and does not represent installation or troop counts.

Independent scales preserve visual comparison without adding unlike measures. Close locales are offset for legibility. QAT is strategic context outside the 12 UCDP event locales; its conflict stack is absent.

Source years remain those printed on the following precise comparison page.

CONFLICT PERIOD / LATEST AVAILABLE CONTEXT

The war inside unequal living fields

Conflict values use events geocoded to each state during the observed interval. Population-health sources end before 2026, so their latest observations are shown with their actual years rather than projected into the conflict date.

DO NOT MERGE THE SCALES

Fatalities are attached to event location, not nationality. Population is a count; mortality is a rate; fertility and crude birth rate are distinct birth measures. Bar length compares countries within one row only.

UCDP SIDE A

Iran

Party role, event-location exposure, and population-health context remain separate. Event counts below mean records geocoded to this state, not a complete measure of attacks conducted, forces deployed, or national deaths.

SIDE A / CANDIDATE LAYER

79 events / 3,622 best

V-DEM 2024

Electoral autocracy

EVENT-LOCATION BOUNDARY

79 observations geocoded here; summed best estimate 3,622.

UCDP SIDE B

Israel

Party role, event-location exposure, and population-health context remain separate. Event counts below mean records geocoded to this state, not a complete measure of attacks conducted, forces deployed, or national deaths.

SIDE B / CANDIDATE LAYER

4 events / 9 best

V-DEM 2024

Electoral democracy

EVENT-LOCATION BOUNDARY

4 observations geocoded here; summed best estimate 9.

UCDP SIDE B

United States of America

Party role, event-location exposure, and population-health context remain separate. Event counts below mean records geocoded to this state, not a complete measure of attacks conducted, forces deployed, or national deaths.

SIDE B / CANDIDATE LAYER

0 events / 0 best

V-DEM 2024

Liberal democracy

EVENT-LOCATION BOUNDARY

No event location in the loaded interval.

The regional surface appears immediately

Every mark is one candidate event positioned by start date and grouped vertically by recorded locale. Marker area rises with reported best-estimate fatalities; blank periods remain blank.

INTERPRETIVE FRONTIER

Temporal sequence can test retaliation and escalation accounts, but direction must be read from event-level actor and source records rather than inferred from locale alone.

WEBSITE TOPOLOGY / PRINT FIELD

Parties, vulnerability field, locales, events

The formal dyad remains at the core. GCC countries are rendered as a distributed vulnerability field, not as members of either side. Every candidate event remains connected to its recorded locale; observation-node area follows best-estimate fatalities.

EDGE SEMANTICS

Party-to-locale lines retain the website relation: a side participant belongs to the dyad in which an event is recorded at that locale. They do not assert that every party acted at every location.

BARABASI DIAGNOSTICS

Degree, betweenness, and proportional structure

Topology is calculated on the complete print graph, including all candidate-event leaves. Degree counts direct relations; normalized betweenness measures shortest-path brokerage. Neither statistic is replaced by a narrative assignment.

HIGHEST STRUCTURAL DEGREE

HIGHEST NORMALIZED BETWEENNESS

COMPLETE GRAPH

146 nodes / 181 edges / density 0.0171. Degree distribution: 1:128 / 3:1 / 5:5 / 7:2 / 8:1 / 11:2 / 12:1 / 13:3 / 14:2 / 83:1

Node size in the network: locale nodes follow event count; event nodes follow best-estimate fatalities; other structural nodes follow degree. This preserves proportionality without treating event count, fatalities, and centrality as interchangeable.

PROVENANCE AND OPEN FRONTIER

Sources / snapshots / limits

This proof is generated from repository data. The conflict is current, but the print record is only current through its stated UCDP candidate-event boundary.

LOADED CANDIDATE LAYER

125 unique events / 28 February-30 July 2026 / 3,808 summed best-estimate fatalities. Source snapshots: ucdp-candidate-ged-2026-06: 102; ucdp-candidate-ged-2026-07: 23. Coding status: Check: 3; Check deaths: 14; Check dyad: 9; Check geography: 24; Check type of violence: 3; Check vague or biased source: 2; Clear: 70.

REVISION PATH

Regenerate when a new candidate snapshot is deposited. Preserve event IDs, compare revisions, and update the observation boundary. Do not silently carry July values to the publication date or convert candidate coding into a final historical record.
